Restriction Endonuclease *Dra* I

From *Deinococcus radiophilus*

TTT↓AAA
AAA↑TTT

Cat. No. 10 827 754 001 5 000 units (10 U/µl)

Version 21
Content version: July 2017
Store at −15 to −25°C

Stability/Storage The undiluted enzyme solution is stable when stored at −15 to −25°C until the control date printed on the label. Do not store below −25°C to avoid freezing.

Sequence specificity *Dra* I recognizes the sequence TTT/AAA and generates fragments with blunt ends (1).

Compatible ends The enzyme generates compatible ends to any blunt terminus.

Isoschizomers *Dra* I is an isoschizomer to *Aha* III.

Methylation sensitivity *Dra* I is not inhibited by the presence of 6-methyladenine, as indicated (°).

Storage buffer 10 mM Tris-HCl, 0.1 mM EDTA, 1 mM DTE, 50 mM KCl, 50% Glycerol (v/v), .05 % Polydocanol, 0.1 mg/ml Bovine Serum Albumin, 0 pH 7.5 (at 4°C).

Suppl. Incubation buffer, 10x 100 mM Tris-HCl, 500 mM NaCl, 100 mM $MgCl_2$, 10 mM Dithioerythritol, pH 7.5 (at 37°C), (= SuRE/Cut Buffer **M)**

Activity in SuRE/Cut Buffer System Bold face printed buffer indicates the recommended buffer for optimal activity:

A	B	L	**M**	H
100%	75-100%	100%	**100%**	50-75%

Incubation temperature **37°C**

Unit definition One unit is the enzyme activity that completely cleaves 1 µg λDNA in 1 h **at 37°C** in SuRE/Cut buffer **M** in a total volume of 25 µl.

Typical experiment

Component	Final concentration
DNA	1 µg
10 × SuRE/Cut Buffer **M**	2.5 µl
Repurified water	Up to a total volume of 25 µl
Restriction enzyme	1 unit

Incubate at **37°C** for 1 h.

Heat inactivation The enzyme cannot be heat-inactivated by heating to 65°C for 15 min.

Number of cleavage sites on different DNAs (2):

λ	Ad2	SV40	Φ X174	M13mp7	pBR322	pBR328	pUC18
13	12	12	2	5	3	5	3

PFGE tested *Dra* I has been tested in Pulsed- Field Gel Electrophoresis (test system bacterial chromosomes). For cleavage of genomic DNA (*E. coli* C600) embedded in agarose for PFGE analysis 10 units of enzyme/µg DNA and 4 h incubation time are recommended.

Activity in PCR buffer Relative activity in PCR mix (Taq DNA Polymerase buffer) is 100%. The PCR mix contained target λDNA, primers, 10 mM Tris-HCl (pH 8.3, 20°C), 50 mM KCl, 1.5 mM $MgCl_2$, 200 µM dNTPs, 2.5 U Taq DNA polymerase. The mix was subjected to 25 amplification cycles.

Ligation and recutting assay *Dra* I fragments obtained by complete digestion of 1 µg λDNA are ligated with 1 U T4-DNA ligase (Cat. No. 10 481 220 001) in a volume of 10 µl by incubation for 16 h at 4°C in 66 mM Tris-HCl, 5 mM $MgCl_2$, 5 mM Dithiothreitol, 1 mM ATP, pH 7.5 (at 20°C) resulting in >70 % recovery of 1 µg λDNA fragments. Subsequent re-cutting with *Dra* I yields > 95% of the typical pattern of λDNA × *Dra* I fragments..

Troubleshooting A critical component is the DNA substrate. Many compounds used in the isolation of DNA such as phenol, chloroform, ethanol, SDS, high levels of NaCl, metal ions (*e.g.*, Hg^{2+}, Mn^{2+}) inhibit or alter recognition specificity of many restriction enzymes. Such compounds should be removed by ethanol precipitation followed by drying, before the DNA is added to the restriction digest reaction. Appropriate mixing of the enzyme is recommended.

Quality control Lot-specific certificates of analysis are available at www.lifescience.roche.com/certificates.

Absence of unspecific endonuclease activities 1 µg λDNA is incubated for 16 h in 50 µl SuRE/Cut buffer M with excess of *Dra* I. The number of enzyme units which do not change the enzyme-specific pattern is stated in the certificate of analysis.

Absence of exonuclease activity Approx. 5 µg [^{3}H] labeled calf thymus DNA are incubated with 3 µl *Dra* I for 4 h at 37°C in a total volume of 100 µl 50 mM Tris-HCl, 10 mM $MgCl_2$, 1 mM Dithioerythritol, pH approx. 7.5. Under these conditions, no release of radioactivity is detectable, as stated in the certificate of analysis.
